MDR SOC Onboarding Prerequisites

Steps required for onboarding

About

This document details all requirements before Degea can assist with SOC onboarding.

Licensing

For full XDR onboarding the following licenses are required:
All licenses are included in Defender Suite (previously Microsoft 365 E5 Security addon)
Services:

- Defender for Endpoint
  - Defender for Endpoint P2
- Defender for Office
  - Defender for Office P2
- Defender for Identity
  - Defender for Identity
- Defender for Cloud Apps
  - Defender for Cloud Apps
- Entra ID Protection
  - Entra ID P2
- Sentinel:
  - A dedicated pay-as-you-go Azure Subscription. If already deployed, use the existing setup

Functionality:

- User isolation
  - Entra ID P2
  - Defender for Cloud Apps

Compliance:

- Each server with EDR requires Defender for Endpoint Server

Security Level Requirements

While there is no strict minimum security level required for MDR SOC implementation, a mature security posture significantly enhances the effectiveness of SOC operations. The following recommendations outline key security controls that should be in place or planned prior to onboarding.

Please note that this list is not exhaustive and assumes fundamental IT hygiene policies, routines, and practices are already established within the environment.

Microsoft 365 Environment

Organizations with Microsoft Security E5 add-on licenses should maintain a Secure Score of 80%, a combined 750 points, or higher for identity and device security, including:

- **Privileged Account Separation** – Privileged accounts must be maintained separately from regular user accounts to mitigate privilege escalation and lateral movement risks
- **Conditional Access Policies** – Comprehensive coverage should include:
  - Multi-factor authentication (MFA) enforcement
  - User risk-based access controls
  - Operating system compliance requirements
- **Application Consent Controls** – User-level application consent should be disabled
- **Authentication Protocol Hardening** – Legacy and insecure authentication methods must be disabled

On-Premises Environment

- **Active Directory Tiering** – Implement an AD tiering model (or equivalent administrative segmentation strategy)
- **Vulnerability Management** – Establish comprehensive vulnerability management processes covering Windows patching, third-party application updates, and end-of-life (EOL) server replacement
- **Security Hardening** – Apply security hardening configurations using Microsoft Security Baselines or equivalent industry-standard frameworks

Endpoint Security

- **Least Privilege Access** – Standard users should not possess local administrator privileges
- **Vulnerability Management** – Maintain comprehensive patch management for Windows updates, third-party applications, and EOL endpoint replacement
- **Security Hardening** – Implement endpoint security hardening using Microsoft Security Baselines or equivalent frameworks

Settings

Change subscription state to Defender for Endpoint Plan 2

Requires sufficient Defender for Endpoint P2 licenses to cover all endpoints.

- **Minimum requirement:** 1 license per 5 endpoints to enable the licensing model
- **Microsoft compliance requirement:** 1 license per workstation user

Note: This change takes up to 24 hours to take effect.

https://security.microsoft.com ➔Settings ➔ Endpoints ➔ [General] Licenses

Hybrid / On-Premises Environments

If on-premises Active Directory or on-premises-managed endpoints (e.g., Windows Servers or domain-joined clients not managed through Intune) are to be monitored, they must be properly onboarded before SOC onboarding can begin.
Our team can assist with the required setup; however, this work is **not included** in the managed onboarding cost and will be billed at the standard hourly rate.

Onboarding of **Defender for Identity (MDI)** and **Defender for Endpoint (MDE/EDR)** must be fully completed before SOC onboarding can proceed.

Defender for Identity (MDI)

Reference:
https://learn.microsoft.com/en-gb/defender-for-identity/deploy/activate-sensor

All **Tier 0** servers must be onboarded to Defender for Identity. This includes, but is not limited to:

- **Active Directory Domain Services (AD DS) Servers**
- **Active Directory Certificate Services (AD CS) Servers**
- **Entra ID Connect (Azure AD Connect) Servers**
- **Active Directory Federation Services (AD FS) Servers**

Modern versions of Windows Server support **automatic sensor deployment**, which can be enabled directly in the Microsoft Defender portal. We strongly recommend using this method unless these servers are already monitored through another approved mechanism.

Make sure to validate sensor health after deployment and promptly resolve any issues reported by the monitoring platform.

Configuration path:
https://security.microsoft.com → **System** → **Settings** → **Identities**

Defender for Endpoint (MDE) - EDR Onboarding

All stand-alone or on-premises-managed endpoints must be onboarded to **Defender for Endpoint EDR**.
Where supported, we recommend using **Group Policy** to automate onboarding for domain-joined devices.

Domain-joined endpoints:
https://learn.microsoft.com/en-us/defender-endpoint/configure-endpoints-gp

Stand-alone endpoints:
https://learn.microsoft.com/en-us/defender-endpoint/configure-endpoints-script

SOP Setup

We can assist with setup according to our SOP documents. If all requirements are met, we offer fully managed onboarding, which requires:

- **Global Administrator account (temporary)** – Needed to consent to applications and configure Sentinel delegation across all subscriptions
- **Contact person for test alert generation** – The final onboarding step requires generating a test alert on a user endpoint. Since fallback methods may need local administrator privileges, the contact must have elevation capabilities (see "9-DEG SOP - Generate a test alert")

Mandate

By default, the SOC is authorized to isolate users, endpoints, and servers when threats are detected. Any exceptions to this mandate should be discussed and agreed upon before onboarding is complete. Without explicit exclusions, we will proceed with standard authorization.

Contact list

Provide contact information for at least two individuals from both your company and your MSP (if applicable). Contacts should have organizational oversight and authority to approve services such as incident response and root cause analysis.
